

The first of these is the fact that the
 world is not a uniform mass of matter
 but is composed of a vast number of
 different kinds of matter, each with
 its own peculiar properties. This is
 the result of the fact that the
 atoms of different elements are
 different in size, weight, and
 electrical charge. It is this
 diversity of matter that makes
 possible the existence of the
 various forms of life and the
 complex structures of the
 universe.
